

Recommended use of BioNutria's products in soya beans

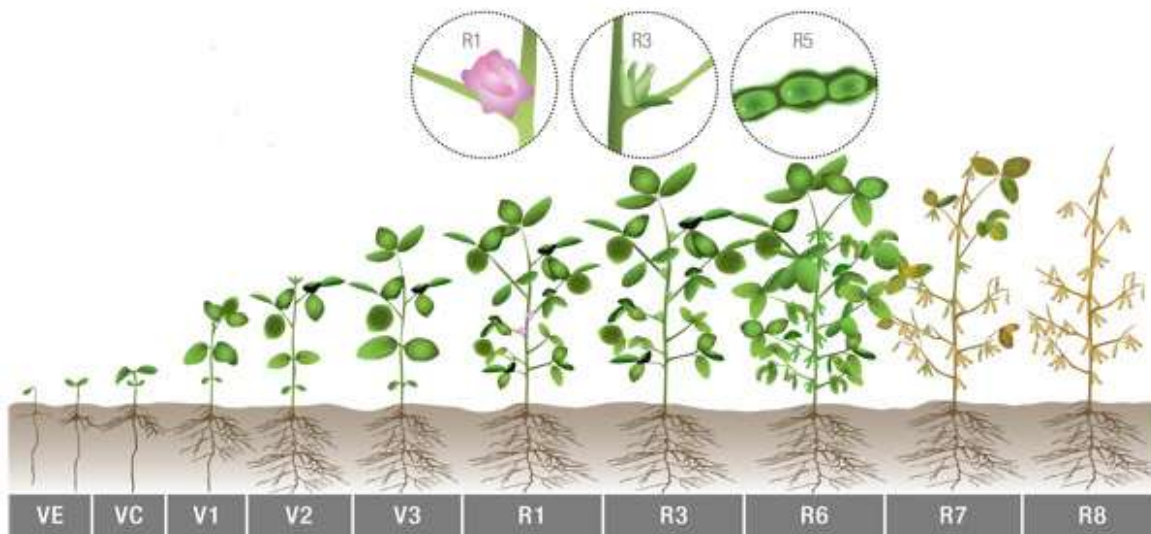

Our products are used as insurance against micronutrient deficiencies. Our general recommendation is to use 2-3 l BioCrop Opti ML and 1 l BioMangan 170 NSP approx. 3-4 times during the growth season.

A treatment scheme for soya beans could be:

Beginning spring: V1-V2	2 l BioMangan 170 NSP + 2 l BioCropOpti ML
mid-spring: V3	1 l BioMangan 170 NSP + 2 l BioCropOpti ML
mid-spring: R1	2 l BioCropOpti ML
beginning summer: R3	2 l BioCropOpti ML

On some soil types there can be challenges with cobber deficiencies. Here we recommend BioMangan 170 NS^{CU} and BioCropOpti^{CU} with extra content of cobber.

Our products are easy to use. They can blend easily with just about all other plant protection agents, so the addition of micronutrients requires no extra applications. This saves the work process and also helps to get both plant protection and micronutrients out on time, which is very important.

Best regards
